                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 9, Application US/08874347;
Sequence 9, Application US/08874347;
Patent No. 5863741
GENERAL INFORMATION:
APPLICANT: Limper, Andrew H.
APPLICANT: Leof, Edward B.
APPLICANT: Thomas, Charles F.
APPLICANT: Gustafson, Michael P.
TITLE OF INVENTION: CDC2 PROTEIN KINASE FROM PNEUMOCYSTIS
TITLE OF INVENTION: CARINII
NUMBER OF SEQUENCES: 26
CORRESPONDENCE ADDRESS: 26
CORRESPONDENCE ADDRESS: 16
STREET: 60 South Sixth Street, Suite 3300
CITT: Minneapolis
CITTLE OF INVENTION: CARINII
NUMBER OF SEQUENCES: 26
CORRESPONDENCE ADDRESS: 7100
CITTLE OF INVENTION: CARINII
COURTY: Minneapolis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MEDIUM_TYPE: Diskette

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence is a cDNA encoding novel human protein (NHP) known as human kinases. The human kinases share structural similarity with cas human kinases. The human kinases of animal kinases, more particularly serine or threonine protein kinases. Human kinase cDNA is useful for the detection of mutant human kinase for the diagnosis of disease, and also as a therapeutic. It is useful for screening drugs effective in the treatment of symptomatic or phenotypic manifestations perturbing the normal function of NHP in the body. The NHP concleotide sequences are useful for generation of antibodies, as reagents in diagnostic assays, for the identification of other cellular gene products related to human kinases, and as reagents in assays for screening compounds that are useful for treating mental, biological or screening compounds that are useful for treating mental, biological or medical disorders. NHP oligonucleotides are used as probes : The labelled NHP polymorphisms and as primers in amplification assays to detect mutations within the exons, introns and splice sites that can be used in diagnostics and pharmacogenomics. Nucleotide construct encoding NHP crocactors in the body delivering a continuous supply of NHP to the body. Nucleotide constructs encoding functional NHPs are used in gene

The present sequence is a cDNA encoding novel human protein (NHP) known as human kinase. The human kinases share structural similarity with animal kinases. More particularly serine or threonine protein kinases. Human kinase cDNA is useful for the detection of mutant human kinase for the diagnosis of disease, and also as a therapeutic. It is useful for streening drugs effective in the treatment of symptomatic or phenotypic manifestations perturbing the normal function of NHP in the body. The NHP nucleotide sequences are useful for generation of antibodies, as reagents in diagnostic assays, for the identification of other cellular gene

                                                                                                     셤
products related to human kinases, and as reagents in assays for screening compounds that are useful for treating mental, biological or medical disorders. NHP oligonucleotides are used as probes. The labelled NHP probes are useful for screening human genomic library for identifying polymorphisms and as primers in amplification assays to detect mutations within the exons, introns and splice sites that can be used in diagnostics and pharmacogenomics. Nucleotide construct encoding NHP products are used to genetically engineer cells in vivo that functions as bioreactors in the body delivering a continuous supply of NHP to the body. Nucleotide constructs encoding functional NHPs are used in gene
                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           300

cardiovascular disorder (e.g., atherosclerosis, hypertension, myocardial infarction), and a lipid disorder (e.g., fatty liver, cholestasis, darchion), and a lipid disorder (e.g., fatty liver, cholestasis, daucher's disease). Niemann-Pick's disease). PKIN is useful in a number of drug screening techniques and to analyse the proteome of a tissue or cell type. PKIN is useful for creating knockin humanised animals or transgenic generate a transcript image of a tissue or cell type. FKIN is useful for creating contains grower to generate a transcript image of a tissue or cell type, for detecting generate a transcript image of a tissue or cell type, for detecting the ct., among normal, carrier or affected individuals, and as hybridisation probes for mapping naturally occuring genomic sequences. PKIN is useful in southern or northern analysis, dot blot or other membrane-based checknologies, in PKR technologies, in dipstick, pin, multiformat enzyme linked immunosorbent (ELISA)-like assays and in microarrays utilising fluids or tissues from patients to detect altered PKIN expression. This invention relates to the CDNA and protein sequences of fifty six polynucleotides for diagnostics and therapeutics (DITHP). The human DITHP polynucleotides and polypeptides are useful for diagnosing, preventing or treating diseases associated with, as well as effects of exogenous compounds, on the expression of human molecules, such as cell compounds, on the expression of human molecules, such as cell compounds, primary thrombocytopenia), autoimmune-inflammatory diseases (e.g. anaemia, asthma, autoimmune thyroiditis, crohn's disease, diabetes arthritis, uveitis, acquired immunodeficiency disease; AIDS; allergies; neurological disorders (e.g. stroke, Alzhaimer's disease, dementia, arthritis, uveitis, acquired immunodeficiency disease; AIDS; allergies; neurological disorders (e.g. stroke, Alzhaimer's disease, dementia, mental retardation, Parkinson's disease, epilepsy), gastrointestinal (e.g. ulcer, cirrhosis), reproductive (e.g. infertility, endometriosis), reproductive (e.g. infertility, endometriosis), hyposylycaemia, hyperparathyroidism, hypercholesterolaemia, hyposylycaemia, hyperparathyroidism, hypercholesterolaemia, hyposylycaemia, hyperparathyroidism, paraaltic, protozoal). The DITHP sequences may be used to viral, fungal, paraaltic, protozoal). The DITHP sequences may be used to viral, fungal, paraaltic, protozoal). The DITHP sequences may be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     occurring genomic sequences. They are also useful in designing probes useful in diagnostic assays. The polynucleotides are useful as molecular weight markers, or as antigen to elicit an immune response. The present
New human diagnostic and therapeutic (DITHP) polynucleotides and polypeptides, useful for diagnosing, preventing or treating diseases, e.g. cancer, AIDS, Parkinson's disease, or autoimmune/inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           sequence represents a human diagnostics and therapeutics (DITHP) cDNA
                                                                                                                                                                     Claim 1; Page 267; 331pp; English

Nucleic acids encoding human kinase polypeptides, useful for preventing diagnosing and/or treating e.g. cancer, immune, cardiovascular and neuronal-associated diseases, and microbial infections. Example 1; Fig 1; 433pp; English.

novel AASO6701-AASO6757 encode for novel human protein kinases #1-57. The protein kinases have been identified as members of the tyrosine or serine/threonine kinase (PTK and STK) families. The polynucleotides encoding protein kinases and the polypeptides may be used in the prevention, diagnosis and treatment of diseases associated with

906 781 GAAGACATGGAAACTCTTGAGGAAAAGTTCTCAGATGTTCATCCTGTGGCTCTGAACTTC 840 The present sequence is a cDNA encoding novel human protein (NHP) known as human kinases. The human kinases share structural similarity with human kinases, more particularly serine or threonine protein kinases. The diagnosis of disease, and also as a therapeutic. It is useful for screening drugs effective in the treatment of symptomatic or phenotypic manifestations perturbing the normal function of MHP in the body. The NHP uncleotide sequences are useful for generation of antibodies, as reagents in diagnostic assays, for the identification of center cellular gene products related to human kinases, and as reagents in assays for screening compounds that are useful for treating mental, biological or medical disorders. MHP oligonucleotides are used as probes. The labelled PNHP probes are useful for screening human genomic library for identifying polymorphisms and as primers in amplification assays to detect mutations 847 AGCTCCTACTTTGATTCTTTTCAAGAGGCCCAAATTAAAAGAAAAGGACGTAATGAAGGA /product= "Human kinase #5" /note= "The coding region does not include stop codon" New isolated human kinase polynuclectide useful for generating antibodies, as reagents in diagnostic assays and for screening for compounds useful for treating mental, biological or medical diseases. within the exons, introns and splice sites that can be used in diagnostics and pharmacogenomics. Nucleotide construct encoding NHP products are used to genetically engineer cells in vivo that functions bioreactors in the body delivering a continuous supply of NHP to the body. Nucleotide constructs encoding functional NHPs are used in gene therapy for the modulation of NHP expression

the diagnosis of disease, and also as a therapeutic. It is useful for screening drugs effective in the treatment of symptomatic or phenotypic manifestations perturbing the normal function of NHP in the body. The NHP muclectide sequences are useful for generation of antibodies, as reagents in diagnostic assays, for the identification of other cellular gene products related to human kinases, and as reagents in assays for medical disorders. NHP oligonucleotides are used as probes. The labelled NHP probes are useful for treating mental, biological or medical disorders. NHP oligonucleotides are used as probes. The labelled polymorphisms and as primers in amplification assays for identifying within the exons, introns and splice sites that can be used in diagnostics and pharmacogenomics. Nucleotide construct encoding NHP

antibacterial, virucide, protozoacide and fungicide activities. The kinase and phosphatase (KPP) polynuclectides, polypeptides, agonists and antagonists may be useful for diagnosing, treating or preventing disorders such as cardiovascular diseases, immune system disorders, neurological disorders, disorders affecting growth and development, cell proliferative disorders and viral, bacterial, fungal, parasitic, protozoan or helminthic infections. Furthermore, the molecules of the invention may be useful for creating transgenic animals to model human disease and during gene therapy. The current sequence is that of a human

or hepatit
                                                                                                                                                                                                                            1074
```

The present sequence encodes a human kinase and phosphatase (KPP)

protein. KPP sequences have cardiovascular, antiarteriosclerctic,

contiallergic, antianthmatic, antianginal, anti-HIV,

contiallergic, antianthmatic, immunosuppressive, antithyroid,

dermatological, antidiabetic, impurosuppressive, antithyroid,

continematic, antidiabetic, impurosuppressive, antithyroid,

continematic, antidiabetic, inpurotropic, anticonvulsant, hepatoriopic,

continematic, antiparkinsonian, noorropic, anticonvulsant, hepatoriopic,

continematic, antiparkinsonian, noorropic, antilipaemic, antiparasitic,

continematic, antibacterial, virucide, protozoacide and fungicide

continematics and be used in gene therapy, and as kinase modulators and

phosphatase modulators. KPP proteins, polymucleotides, agonists and

continematics can be used for diagnosing, treating or preventing disorders

continematics and be used for diagnosing, reating or preventing disorders

consective heart failure), immune system disorders (e.g. athrosoclerosis, phopertension, vasculitis, angina pectoris

consective heart failure), immune system disorders (e.g. AlDS,

allergies, asthma, autoimmune thyroiditis, contact dermatitis, contact

consective heart failure), immune system disorders (e.g. AlDS,

contactive heart failure, minutiple sclerosis, osteoarthritis,

conteoporosis, pancreatitis, Reiter's syndrome, theumatoid arthritis,

conteoporosis, pancreatitis, neurological disorders (e.g. Alzheimer's

conteoporosis, pancreatitis, neurological disorders (e.g. Alzheimer's

conteoporosis, pancreatitis, neurological disorders (e.g.

conteoporosis, pancreatitis, neurological disorders (e.g.

conteoporosis, pancreatitis, neurological disorders (e.g.

conteoporosis, pancreatitis, neurological disorders (e.g.

conteoporosis, pancreatitis, neurological disorders (e.g.

conteoporosis, pancreatitis, neurological disorders (e.g.

conteoporosis, pancreatitis, neurological disorders (e.g.

conteoporosis, neurological disorders (e.g.

conteoporosis, one conteoporosis, one 5; SEQ ID NO 94; 330pp; English Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated 14257 polypeptide and nucleic acid encoding it. The 14257 protein is a protein kinase that acts as a modulating agent in regulating a variety of cellular processes, including cell proliferation, differentiation, growth and division. The activity of the protein of the invention may be described as; cytostatic; osteopathic; hepatotropic, antidiabetic; neuroprotective, antiarthritic; antiparthritic; antiparthritic; antipsoriatic; ophthalmological; antiallergic; antiarthritic; antipsoriatic; ophthalmological; antiallergic; antiarthritic; antipsoriatic; ophthalmological; antiallergic; antiarthritic; antiparthritic; antiparthritic; antiparthritic; antiparthritic; antiparthritic; antiatherosclerotic; hypotensive; vasotropic; antiarthritic; cancetic; metabolic; immunomodulator and analgesic. The protein of the invention may act as a novel diagnostic target or therapeutic agent controlling certain disorders, for example kinase-associated or other controlling certain disorders. These may include cellular proliferative disorders such as cancers e.g. acute lymphoblastic leukemia or Hodgkin's disease. Other disorders include bone metabolism disorders such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    o;

complementary sequences may also be used as DNA probes in diagnostic assays. The kinase polypeptides may be used as antigens in the production of antibodies of kinase expression and activity. Anti-kinase antibodies and kinase expression and activity. Anti-kinase antibodies expression and activity. Diseases related to kinase expression and activity. Diseases related to kinase expression and activity include rheumatoid arthritis, atherosclerosis, autoimment immune disorders, camplications of organ transplantation, myocardial infarction, stress related disorders, cardiomyopathies, strokes, renal failure, oxidative-inflammatory pelvic disease, multiple sclerosis, ashma, osteoarthritis, psoriasis, rhinitis, autoimmunity, diabetes, cancers and reproductive
                                                                                                                                                                                                                                                                                                                                            584

The invention relates to a compound comprising a sequence comprising 8-80 (MAP/microtubule affinity-regularing kinase 3), that specifically hybridises with the nucleic acid encoding MARK3 and inhibits expression of MARK3, i.e. is an antisense oligonucleotide (AO). Also included are a composition comprising the compound and a carrier or diluent, inhibiting suspected of having a disease or condition associated with MARK3 and suspected of having a disease or condition associated with MARK3 and useful for preparing a composition for treating hyperproliferative disorder, particularly cancer and neurodegenerative diseases e.g. Alzheimer's disease. The present sequence is a MARK3 associated onn manifely manifely decided in the figures but not mentioned anywhere else in the
                                                                                                                                                                                                                                                                                                                                                                                               New antisense compound targeted to a nucleic acid molecule encoding microtubule-affinity-regulating kinases (MARK3), useful for modulating expression of MARK3 or for treating cancer or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 911 BP; 293 A; 182 C; 178 G; 258 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence encodes a novel protein kinase. The nucleic acids and the protein kinases they encode may be used in the treatment and diagnosis of diseases associated with inappropriate kinase expression such as immune-related diseases and disorders, cardicovascular disease, neurodegenerative diseases and/or cancers. The nucleic acids and neurodegeneraty educaces may also be used as DNA probes in diagnostic assays. The kinase polypeptides may be used as antigens in the production of antibodies of kinase expression and activity. Anti-kinase antibodies expression and activity biseases related to kown regulate kinase expression and activity. Diseases related to kinase expression and activity biseases related to kinase expression and activity include rheumatoid arthritis, atherosclerosis, autoimmune

Also included are a the expression of MARK3 in cells or tissues, treating an animal having or sereening of mark3 and sereening a composition of the expression of MARK3 and a carrier or diluction or sereening a composition for treating Myperprofiferative last of the expression of mark and markalating for an antisense compound. The antisense oligonucleotide is disorder, particularly cancer and neurodegenerative diseases e.g. Alzheimer, a disease. The present sequence is a MARK3 associated cDNA included in the figures but not mentioned anywhere else in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              194

Claim 1; SEQ ID NO 240; 339pp + Sequence Listing; English.

XX

This invention describes a novel disease detection and treatment molecule or propyeptide (MDDT) which has anti-inflammatory, immunosuperssive, osteopathic, cytostatic, anti-inflammatory, immunosuperssive, osteopathic, cytostatic, anti-inflammatory, immunosuperssive, osteopathic, antipsoriatic and hepatotropic activity. The polymocleotides of particularly useful for diagnosing, treating or preventing cell particularly useful for diagnosing, treating or preventing cell confidence, inflammation, coancers including vellored are expected or particularly useful for diagnosing, treating or preventing cell confidence, inflammation, coancers including vellored in the disclosure of the printed correction, but was obtained by the MDT polypeptides are prevented in the sequence data for this patent did not form part of the printed correction, but was obtained by engage engage engage engage engage engage engage engage engage engage engage engage engage engage engage engage engage engage engage engage engage engage engage engage engage engage engage engage engage engage en

The present sequence is novel human protein (NHP) known as human kinase. The human kinases share structural similarity with animal kinases, more particularly serine or threonine protein kinases. Human kinase cDNA is useful for the detection of mutant human kinase for the diagnosis of disease, and also as a therapeutic. It is useful for screening drugs effective in the treatment of symptomatic or phenotypic manifestations perturbing the normal function of NHP in the body. The NHP nucleotide sequences are useful for generation of antibodies, as reagents in diagnostic assays, for the identification of other cellular gene products related to human kinases, and as reagents in assays for screening compounds that are useful for treating mental, biological or medical

```
probes are useful for screening human genomic library for identifying polymorphisms and as primers in amplification assays to detect mutations within the exons, introns and splice sites that can be used in diagnostics and pharmacogenomics. Nucleotide construct encoding NHP products are used to genetically engineer cells in vivo that functions as bioreactors in the body delivering a continuous supply of NHP to the body. Nucleotide constructs encoding functional NHPs are used in gene therapy for the modulation of NHP expression
                                                                                                                                                                                                                                                                                                                                                       120

```
The present invention relates to an isolated human kinase polypeptide (PKIN) or a biologically active/immunogenic fragment of PKIN. PKIN is useful for diagnosing, treating and preventing cancer (e.g., Deukaemia, I ymphoma, melanoma), an immune disorder (e.g., acquired immunodeficiency syndrome (AIDS), Addison's disease, allergy, anaemia, asthma, Crohn's disease, rheumatoid arthritis), a growth and developmental disorder (e.g. bursitis, cirrhosis, hepatitis, psoriasis, Cushing's syndrome), a cardiovascular disorder (e.g., atherosclerosis, hypertension, myocardial infarction), and a lipid disorder (e.g., fatty liver, cholestasis, Gaucher's disease, Niemann-Pick's disease). PKIN is useful in a number of cirry screening techniques and to analyse the proteome of a tissue or cell type. PKIN is useful for creating knockin humanised animals or transgenic animals to model human diseases, in sometic or gernling gene therapy, to generate a transcript image of a tissue or cell type, for detecting differences in the chromosomal location due to translocation, inversion, etc., among normal, carrier or affected individuals, and as Pybridisation probes for mapping naturally occurring genomic sequences. PKIN is useful in southern or northern analysis, dot blot or other membrane-based to mouther to morthern analysis, in disptick, pin, multiformat enazyme linked immunosorbent (ELISA)-like assays and in microarrays utilishing the sequence is human PKIN-10
                                                                                                                                                                                                                                                                                                                                                                                         New human kinase polypeptide, useful in diagnosis, prevention and treatment of cancer, immune disorder, growth and developmental disorder, cardiovascular disorder and lipid disorder.
                                                                                                                                                                                  Thornton M, Yue H, Khan FA, Gururajan R, Hafalia AJA, Walia NK;

The present sequence is novel human protein (NHP) known as human kinase.

The human kinases share structural similarity with animal kinases, more particularly series or threonine protein kinases. Human kinase cDNA is useful for the detection of mutant human kinase cDNA is useful for the detection of mutant human kinase for the diagnosis of disease, and also as a therapeutic. It is useful for screening drugs effective in the treatment of symptomatic or phenotypic manifestations perturbing the normal function of NHP in the body. The NHP nucleotide sequences are useful for generation of antibodies, as reagents in diagnostic assays, for the identification of other cellular gene products calated to human kinases, and as reagents in assays for screening compounds that are useful for treating mental, biological or medical disorders. NHP oligonucleotides are used as probes. The labelled NHP probes are useful for screening human genomic library for identifying colymorphisms and as primers in amplification assays to detect mutations within the exons, introns and splice sites that can be used in diagnostics and pharmacogenomics. Nucleotide construct encoding NHP bioreactors in the body delivering a continuous supply of NHP to the body. Nucleotide constructs encoding functional NHPs are used in gene therapy for the modulation of NHP expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated human kinase polynucleotide useful for generating antibodies, as reagents in diagnostic assays and for screening for compounds useful for treating mental, biological or medical diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Zambrowicz

WPI; 2001-266166/27. N-PSDB; AAD03816. New isolated human kinase polynucleotide useful for generating antibodies, as reagents in diagnostic assays and for screening for compounds useful for treating mental, biological or medical diseases.

Claim 2; Page 32-33; 38pp; English.

The present sequence is novel human protein (NHP) known as human kinase.

The human kinases share structural similarity with animal kinases, more particularly serine or threonine protein kinases. Human kinase CDNA is useful for the detection of mutant human kinase. Human kinase CDNA is useful for the detection of mutant human kinase for the diagnosis of disease, and also as a therapeutic. It is useful for screening drugs of effective in the treatment of symptomatic or phenotypic manifestations perturbing the normal function of NHP in the body. The NHP nucleotide sequences are useful for generation of antibodies, as reagents in classed to human kinases, and as reagents in assays for screening classocial or medical disorders. NHP oligonucleotides are used as probes. The labelled NHP compounds that are useful for treating mental, biological or medical disorders. NHP oligonucleotides are used as probes. The labelled NHP colymorphisms and as primers in amplification assays to detect mutations within the exons, introns and splice sites that can be used in diagnostics and pharmacogenomics. Nucleotide construct encoding NHP

AAU03501-AAU03557 represent novel human protein kinases #1-57. The novel protein kinases have been identified as members of the tyrosine or serine/threonine kinase (PTK and STK) families. The polymotheotides carried/threonine kinase (PTK and STK) families. The polymotheotides carried/threonine kinases and the polymothides may be used in the provention, diagnosis and treatment of diseases associated with anappropriate kinase expression. For example, they may be used to treat ancers (especially cancers of hemantopoietic origin), cardiovascular disease (e.g. atherosclerosis), metabolic disorders (e.g. diabetes), immune related diseases (e.g. rheumatodid arthritis), neurological disorders (e.g. schizophrenia), neurological disorders (e.g. disease), inflammatory disorders (e.g. asthma), infectious disease (e.g. HIV) and reproductive disorders (e.g. infertility). Additionally, polymuclectides encoding protein kinases may be used for gene therapy and as DNA probes in diagnostic assays. The protein kinase against the protein kinase santigens in the production of antibodies against the protein kinase such activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120

```

```
The present sequence in the indicative with animal kinases. The human kinases hare structural similarity with animal kinases, more particularly serine or threonine protein kinases. Human kinases con the disponsis of disease, and also as a therapeutic. It is useful for screening drugs effective in the treatment of symptomatic or phenotypic manifestations effective in the treatment of symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body. The NHP mucleotide sequences are useful for generation of antibodies, as reagents in disponsite assays, for the identification of other cellular gene products related to human kinases, and as reagents in assays for screening compounds that are useful for treating mental, biological or medical disponders. NHP oligonucleotides are used as probes. The labelled NHP probes are useful for screening human genomic library for identifying probes are useful for screening human genomic library for identifying colymorphisms and as primers in amplification assays to detect mutations within the exons, introns and splice sites that can be used in disponsities and pharmacogenomics. Nucleotide construct encoding NHP to the body delivering a continuous supply of NHP to the body. Nucleotide constructs encoding functional NHPs are used in gene therapy for the modulation of NHP expression
                                                                                                                                                                                                                                                                                                                                                                                novel human protein (NHP) known as human kinase
                                                                                                                                                                                                                      New isolated human kinase polymucleotide useful for generating antibodies, as reagents in diagnostic assays and for screening for compounds useful for treating mental, biological or medical diseases.

The present sequence is a novel protein kinase. The novel protein kinases and the nucleic acids that encode them may be used in the treatment and diagnoshis of diseases associated with inappropriate kinase expression cuch as immune-related diseases and disorders, cardiovascular disease, neurodegenerative diseases and/or cancers. The nucleic acids and complementary sequences may also be used as DNA probes in diagnostic assays. The kinase polypeptides may be used as antigens in the production of antibodies of kinase expression and activity. Anti-kinase antibodies expression and activity, Diseases related to kinase expression and activity. Diseases related to kinase expression and activity include rheumatorid arthritis, atherosclerosis, autoimmune disorders, cardiomyopathies, strokes, renal failure, oxidative-stress related disorders, chronic inflammatory powel disease, chronic inflammatory pelvic disease, multiple sclerosis, asthma, osteoarthritis, postiasis, rhinitis, autoimmunity, diabetes, cancers and reproductive

cancer;

```
The invention relates to a compound comprising a sequence comprising 8-80 base pairs (bp) targeted to a nucleic acid encoding MARK3 (MAP/microtubule affinity-regularing kinase 3), that specifically hybridises with the nucleic acid encoding MARK3 and inhibits expression of MARK3, i.e. is an antisense oligonuclectide (AO). Also included are a composition comprising the compound and a carrier or diluent, inhibiting the expression of MARK3 in cells or tissues, treating an animal having or suspected of having a disease or condition associated with MARK3 and secreting for an antisense compound. The antisense oligonuclectide is useful for preparing a composition for treating hyperproliferative disorder, particularly cancer and neurodegenerative diseases e.g. Alzheimer's disease. The present sequence is a MARK3 associated protein included in the figures but not mentioned anywhere else in the

(I), (II) and (III) are useful for diagnostic evaluation of disorders.

(I) is useful for gene therapy of diseases and (II) can be used for therapeutic treatment. Diseases that may be treated include wound healing and tissue repair, burns, central nervous system disorders (e.g. Alzheimer's, Parkinson's, Huntington's and amylotrophic lateral sclerosis, immune deficiencies, cancer, autoimmune disorders, multiple sclerosis, diabetes and allergies. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                             Human, vulnerary, dermatological, neuroprotective, nootropic, cancer, antiparkinsonian, immunostimulant, cytostatic, immunosuppressive, antialiabetic, antiallergic, gene therapy, wound healing; tissue repair, burn, central nervous system disorder, Alzheimer's disease; Parkinson's disease; Huntington's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polynucleotide and polypeptides, useful for treatment and diagnosis of Alzheimer's, Parkinson's, Huntington's, amylotrophic lateral sclerosis, immune deficiencies, cancer, autoimmune disorders, multiple sclerosis, diabetes and allergies.

ä
a mammalian cell comprising contacting the cell with an agent that specifically binds a CDKL1 polypeptide or nucleic acid; and (3) a method for diagnosing a disease in a patient. The CDKL1 polypeptide or nucleic acid is useful for modulating branching morphogenesis in a mammalian cell. It is also useful for diagnosing a disease, e.g. angiogenic, apoptotic or proliferation disorder in a patient. The present sequence represents human CDKL1, which is used in the exemplification of the present invention. The human CDKL1 gene is located on chromosome 14, more

The present sequence is a novel protein kinase. The novel protein kinases and the nucleic acids that encode them may be used in the treatment and diagnosis of diseases associated with inappropriate kinase expression such as immune-related diseases and disorders, cardiovascular disease, neurodegenerative diseases and/or cancers. The nucleic acids and neurodegenerative diseases and/or cancers. The nucleic acids and assays. The kinase polypeptides may be used as antigens in the production of antibodies of kinase expression and activity. Anti-kinase antibodies and kinase antagonists may also be used to down regulate kinase antibodies cand kinase antagonists may also be used to down regulate kinase activity include rheumatoid arthritis, atherosclerosis, autoimmune disorders, camplications of organ transplantation, myocardial infarction, immune disorders, cardiomyopathies, strokes, renal failure, oxidativestress related disorders, chronic inflammatory pelvic disease, multiple sclerosis, asthma, osteoarthritis, disparents in thinitis, autoimmunity, diabetes, cancers and reproductive

The invention relates to a compound comprising a sequence comprising 8-80 base pairs (bp) targeted to a nucleic acid encoding MARK3 (MAP/Microtubule affinity-regulating kinase 3), that specifically hybridises with the nucleic acid encoding MARK3 and inhibits expression of MARK3, i.e. is an antisense oligonucleotide (AO). Also included are a composition comprising the compound and a carrier or diluent, inhibiting the expression of MARK3 in cells or tissues, treating an animal having or suspected of having a disease or condition associated with MARK3 and screening for an antisense compound. The antisense oligonucleotide is useful for preparing a composition for treating hyperproliferative disorder, particularly cancer and neurodegenerative diseases e.g. Alzheimer's disease. The present sequence is a MARK3 associated protein included in the figures but not mentioned anywhere else in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                215
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 AYTDYVATRWYRAPELLVGDIQYGSSVDIWAIGCVFAELLTGQPLWPGKSDVDQLYLIIR 120

The invention relates to an isolated 14257 polypeptide and nucleic acid encoding it. The 14257 protein is a protein kinase that acts as a modulating agent in regularing a variety of cellular processes, including cell proliferation, differentiation, growth and division. The activity of the protein of the invention may be described as; cytostatic; osteopathic; hepatotropic; antidiabetic; neuroprotective; antiarthritic; hepatotropic; antidiabetic; natiallergic; antiarthritic; antiparthritic; ophthalmological; antiallergic; antiarthritic; antiatherosclerotic; hypotensive; vasotropic; antiarthritic; cancier, immunomodulator and analgesic. The protein of the invention may act as a novel diagnostic target or therapeutic agent controlling certain disorders, for example kinase-associated or other controlling certain disorders. These may include cellular proliferative disorders such as cancers e.g. acute lymphoblastic leukemia or Hodgkin's disease. Other disorders include bone metabolism disorders such as
                                                                                                                                                                                                                                                                          /note= "kinase transferase protein serine/threonine-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher exaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

Claim 1; Fig 4; 64pp; English.

The present sequence represents a learning-induced kinase, designated KKIAMRE kinase, which is isolated from rabbit brain tissue. KKIAMRE kinase is a cdc2-related kinase. The KKIAMRE kinase polynucleotides can be used to express recombinant protein for analysis, characterisation or therapeutic use, as markers for tissues in which the protein is preferentially expressed, as molecular weight markers on Southern gels, as chromosome markers or tags, to compare endogenous DNA sequences in patients to identify potential genetic disorders, as probes to hybridise and discover novel related sequences, as a source of PCR primers, and as
